The world's first photographic memory pill

Don't Forget Them, Frame-Mem!
Richmond, Virginia

What is the Frame-Mem Pill?

The Frame-Mem pill is an orally administered pill that provides the user with a 4-hour period to collect 100 photographic memory “frames” and store them within their long-term memory.

When the user wishes to utilize information from previously recorded memory “frames,” the Frame-Mem pill allows the individual to mentally visualize the picture with 100% accuracy and the same level of clarity as the day they initially saved their memory “frame.”

What is Frame-Mem Excellence?

Frame-Mem is dedicated to offering the public rigorously tested and scientifically backed products. As a medicinal chemist, our company’s CEO Finn Mertens originally discovered the compound Memorizium used in the Frame-Mem pill.

- ❖ Memorizium enhances *preexisting* physiological functions by linking photoreceptors and brain neurons from long-term storage areas to mentally recreate the recorded image in the user’s mind.
- ❖ In collaboration with independent medical researchers, the Frame-Mem pill has undergone five separate, three-year-long clinical trials covering both pediatric and geriatric populations.
- ❖ After producing successful results in all clinical trials, the Frame-Mem pill received FDA approval for public use.

Why the Frame-Mem Pill?

The Frame-Mem Pill offers a plethora of benefits to a diverse range of populations and backgrounds including:

- ❖ Average adults looking to improve their memory and enhance workplace performance,
- ❖ College students aiming to excel in and retain critical course information for their later careers, and
- ❖ Elderly individuals seeking to stave off memory lapses that occur with normal aging.

The Frame-Mem pill is also capable of assisting individuals with neurodegenerative conditions that impact memory by allowing them to save as well as create new enduring memories.
