

Table 1

t-Test Results for Differences in Other Household Member Participation and How Much Assistance Required from Child/Children

Groups	Mean	t	df	p-value
1	7.62	1.66	29.02	0.1085
2	6.50			

Note. * Participants that answered yes to the question of if anyone else in the household participated were recoded to 1, and no responses were recoded to 2.

* The calculated value was then compared to the critical values of * $p < .05$. ** $p < .01$. and *** $p < .001$. $df = 29.02$

There is no significant difference between the means. The p-value of 0.1085 is greater than .05, so we are less than 68% confident that there is a difference in how much assistance required from the child/children and other household member participation. Thus, there is no statistical evidence that participation of any other members living in the household has any affect on the amount of assistance required from the child/children participating in the activities.
