

Tyra Nevers

Personal Statement

My interest in neuroscience goes back as far as I remember. As a child, I would ask my dad if he could look at my hand to see if they were stable and still enough. I would spend hour trying to preform brain surgery on my stuffed animals. My love and curiosity of neuroscience increased about my aunt passed away from a brain tumor. After then I spend hours on end studying the brain and learning the different function of the brain.

I continued my biology and neuroscience studies at Longwood University, where I am expose to many different field of biology, but none of them can take me from my attended path. I enjoyed many of my biology class that are aimed towards many different fields and currenting taking one, but I'm not sure if I would enjoy being anything other than a brain surgery. My heart and my mind are set on being a brain surgeon and I will be anything that would help me achieve that goal. I'm currenting enrolled in Longwood University with a biology major and a chemistry and neuroscience. And hopefully to attend a graduate that will help me tends that goal.

Throughout my semester at Longwood university I am learning lab skills. Such as design guide RNA, BspQ1 digestion, ligation, plasmid purification, and many more skills that would help me in a laboratory setting. The reason I think is important because that would have me in the laboratory setting on my job.

I hope to continue my love of neuroscience and biology and I believe Longwood University can aim toward my dream and help follow my dream. By having a neuroscience will help achieve my goal of becoming a neurosurgeon. And with the help of your undergrad internship I would follow my dream.
