

Table 2. Analysis of Variance (ANOVA) of family involvement by completion

Completion	Mean Family involvement	F-value
Yes	7.25	0.1598
No	0	
Partially	6.50	

Note: $p < .05^*$, $p < .01^{**}$, $p < .001^{***}$

The dependent variable is family involvement. The independent variable was completion of the activity. Respondents choose either yes, no or partially. The mean involvement for the answer chooses yes was 7.25 out of 10. The mean involvement for the answer chooses no was 0. This was 0 because there were no responses to this category. The mean involvement for partially was 6.50 out of 10. According to the ANOVA results ($F=0.1598$) there is no significant difference between these means. Therefore, completion of activity does not influence family involvement.
