

Table 1. Chi squared of parent engagement by household income

	Low Income	High Income	Total
Low Engagment	4	0	4
High Engagment	28	20	48
Chi Squared			1.234

Note: $p < .05^*$, $p < .01^{**}$, $p < .001^{***}$

There is no significance. The independent variable for this Chi-squared test was household income. The dependent variable was parental involvement in the activity. For household income respondents chose either, less than \$10,000, \$10,000 – \$30,999, \$31,000 – \$50,999, \$51,000 – \$70,999, \$71,000 – \$90,999, and \$ 91,000 or more. These variables were recoded into low- and high- income categories. Those variables were tested against the levels of engagement which were also recoded into high and low categories. According to this Chi-squared test there is no significance because the level of engagement of those who selected low income for the activity is not different from the level of engagement of those who selected one of the high income categories.
