

## Pearson's Correlation

**Results:** A Pearson's Correlation examined the relationship between level of involvement of an activity(v16) and willingness to do *Family Fun Time Activities* in the future. Both variables were in the format of a 0 to 10 scale, 0 being “not at all” and 10 being “a great amount”. Pearson's Correlation of  $-.043$  showed no significance between the two variables. Therefore we can determine that there is no significant correlation between the two variables v16 and v17.
