

Table 1. Chi-squared of involvement by parent's highest level of education

Level of Education	Some High School	HS / GED	All Else	Total
Low involvement	9	21	4	34
High involvement	5	20	4	29
Chi-square				0.77

Note: $p < .05^*$, $p < .01^{**}$, $p < .001^{***}$

The dependent variable for this Chi-square was family involvement. This was asked on a 0-10 scale. The independent variable for the Chi-square was level of education. Respondents chose either, "some high school", "high school or GED", or "All else". For 'some high school', the level of engagement for low involvement is 9 and 5 for high involvement. The level of engagement for 'high school or GED' is 21 for low involvement and 20 for high involvement. The level of engagement for 'all else' for both low and high involvement is 4. The total for low involvement equalled 34 and equalled 29 for high involvement. Low involvement is measured from 0-7 and high involvement is measured from 8-10. The Chi-squared is 0.77. According to the Chi-square results ($P=.67$), there is no significance between these means. This is because the P value is greater than .05.
